

# Mass Spectroscopy

- Small amount of sample needed  
usually  $10^{-6}$  or  $\mu\text{g}$  quantities

Many types of Ionization

⇒ Electron Impact (EI)

good for molecules upto 3500 g/mol

Electrospray Ionization (ESI)

good for molecules upto 100,000 g/mol

Instruments can be high resolution or low resolution

High resolution - 7 or 8 sig figs on molar mass

$$M^+ = 58.04187 \text{ m/z}$$

Low resolution - 4 sig figs on molar mass

$$M^+ = 58.04 \text{ m/z}$$

### Low Resolution

How many molecular formulas  
fit 58.04 m/z ratio?

- 16 molecular formulas  
by calculator that  
match

### High Resolution Data

How many fit  
58.04187 m/z ratio?

only 1 formula

Frequently use with mass spec calculators  
which make it easier, but also frequently  
done by hand w/ low res data.

## Formation of $M^+$

Highest occupied molecular orbital  
is a  $\pi e^-$  or lone pair

Molecular ions can fragment by homolytic or heterolytic cleavage

Homolytic

Fragment

$m/z$

visible

$m/z = 43$

Loss

Invisible to mass spec

Heterolytic

Loss

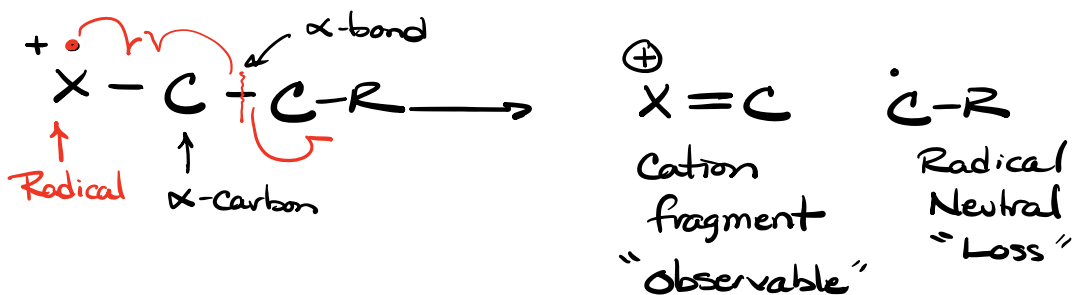

$m/z = 15$

Two main types of cleavages that we look for:

alpha  $\alpha$

McLafferty

$\alpha$

X can be any element.

Usually O, N, halogen, but  
Can also be Carbon

McLafferty Special type with carbonyls  
of all types

## Molecular Ion

Three ways to find the molecular formula.

- Mass Spec Calculator

- Rule of 13

-  $^{13}\text{C}$  isotope ratio

## Rule of 13

Organic molecule will have C:H ratio that is 1:1

C-H (CH)

$$12\text{amu} + 1\text{amu} = 13\text{amu}$$

M/z ratio = 86  $\text{C}_x\text{H}_y$

$$\begin{array}{r} 6 \\ 13 \overline{)86} \\ \underline{78} \end{array}$$

8 remainder

$$\begin{array}{r} x \\ \text{CH} \overline{)C_xH_y} \end{array}$$

remainder = additional Hydrogens  
 $\text{C}_x\text{H}_y$

$\text{C}_6\text{H}_6 + 8\text{amu's left}$   
+8  $\hookrightarrow$  8H's

$$\begin{array}{r} 6 \times 12 = 72 \\ 1 \times 14 = 14 \\ \hline 86 \end{array} \checkmark$$

Try Rule 13 w/  $m/z = 212$

$$13 \overline{) 212} \begin{array}{r} 16 \\ 208 \\ \hline 4 \end{array}$$

$$C_{16}H_{20} \quad \begin{array}{r} 16 \times 12 = 192 \\ 20 \times 1 = 20 \\ \hline 212 \checkmark \end{array}$$

$$1C = 12H \\ 12amu \quad 12amu$$

$$C_{15}H_{20+12} = C_{15}H_{32}$$

Convert Carbons mass into hydrogen

$$\begin{array}{r} 212 \\ \hline 13 \overline{) 212} \begin{array}{r} 16 \\ 208 \\ \hline 4 \end{array} \\ \hline C_{16}H_{20} \quad \begin{array}{r} 34 \\ -20 \\ \hline 14 \\ 7 \text{ units unsat} \end{array} \\ C_{15}H_{32} \quad \begin{array}{r} 32 \\ -32 \\ \hline 0 \text{ units unsat} \end{array} \end{array}$$

What about other elements?

$$13 \overline{) 86} \begin{array}{r} 6 \\ 78 \\ \hline 8 \end{array}$$

$$12amu \quad 12amu$$

$$1C = 12H$$

$$16amu \quad 16amu$$

$$O = CH_4$$

$$14amu \quad 14amu$$

$$N = CH_2$$

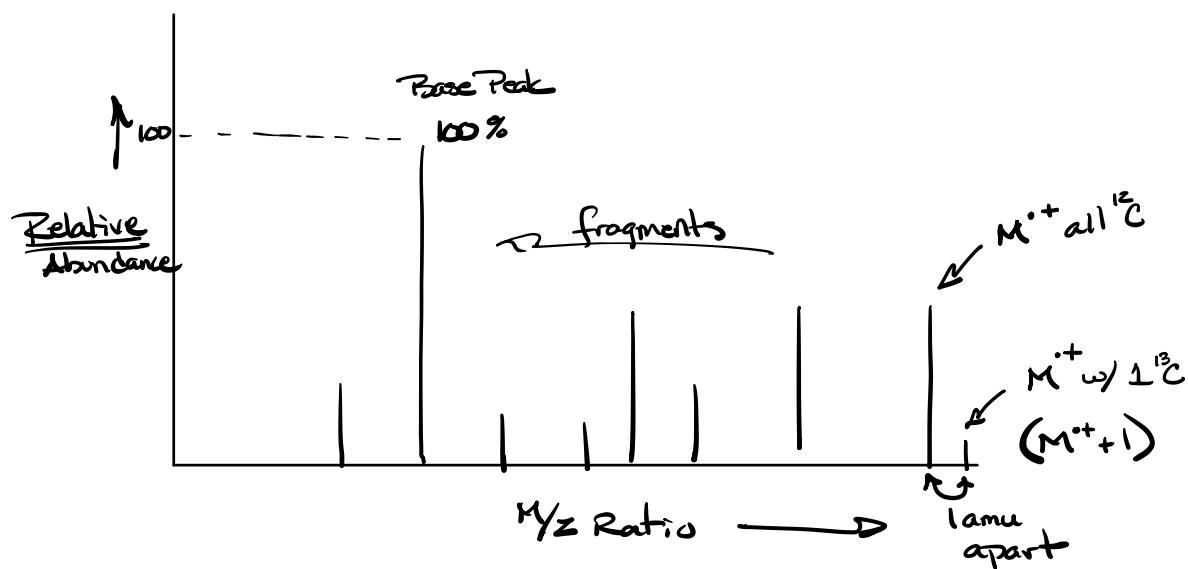

$$35amu \quad 35amu$$

$$Cl = C_2H_{11}$$

How many Carbons are in our molecule?

⇒  $^{13}\text{C} : ^{12}\text{C}$  ratio

$$\frac{\left[ \frac{(\text{M}^+ \text{ w/ } 1 \text{ } ^{13}\text{C}) \text{ Relative abundance}}{(\text{M}^+ \text{ all } ^{12}\text{C}) \text{ Relative abundance}} \right] \times 100}{1.1\% \text{ (} ^{13}\text{C} : ^{12}\text{C} \text{ natural abundance)}} = \# \text{ C in formula}$$
